

**HOMEWORK 4**

DUE WEDNESDAY, NOVEMBER 6, 2019 IN CLASS

## PART I: FROM THE TEXTBOOK

Chapter I, Section 9: **2, 4**

## PART II

- 1. (10 points)** Find a prime  $p$  and quadratic extensions  $K$  and  $L$  of  $\mathbb{Q}$  illustrating each of the following.
- (a)  $p$  can be totally ramified in  $K$  and  $L$  without being totally ramified in  $KL$ .
  - (b)  $K$  and  $L$  can each contain unique primes lying over  $p$  while  $KL$  does not.
  - (c)  $p$  can be inert in  $K$  and  $L$  without being inert in  $KL$ .
  - (d) The residue field extensions of  $\mathbb{Z}/p\mathbb{Z}$  can be trivial for  $K$  and  $L$  without being trivial for  $KL$ .
- 2. (20 points)** Let  $K$  and  $L$  be number fields,  $L$  a normal extension of  $K$  with Galois group  $G$ , and let  $P$  be a prime of  $K$ . By *intermediate field* we will mean an intermediate field different from  $K$  and  $L$ .
- (a) Prove that if  $P$  is inert in  $L$  then  $G$  is cyclic.
  - (b) Suppose  $P$  is totally ramified in every intermediate field, but not totally ramified in  $L$ . Prove that no intermediate fields can exist, hence  $G$  is cyclic of prime order.  
*Hint:* inertia field.
  - (c) Suppose every intermediate field contains a unique prime lying over  $P$  but  $L$  does not. Prove the same as in part (b).  
*Hint:* decomposition field.
  - (d) Suppose  $P$  is unramified in every intermediate field, but ramified in  $L$ . Prove that  $G$  has a unique smallest nontrivial subgroup  $H$ , and that  $H$  is normal in  $G$ ; use this to show that  $G$  has prime power order,  $H$  has prime order, and  $H$  is contained in the center of  $G$ .
  - (e) Suppose  $P$  splits completely in every intermediate field, but not in  $L$ . Prove the same as in part (d). Find an example of this over  $\mathbb{Q}$ .
  - (f) Suppose  $P$  is inert in every intermediate field but not inert in  $L$ . Prove that  $G$  is cyclic of prime power order.  
*Hint:* Use (a), (c), (d) and something from group theory.

**3. (20 points)** Let  $\zeta = \zeta_m$  ( $m \geq 3$ ) be a primitive  $m$ th root of unity. (One may take  $\zeta_m = e^{2\pi i/m}$ .) Set  $\theta = \zeta + \zeta^{-1}$ . Let  $K = \mathbb{Q}(\theta)$  and  $L = \mathbb{Q}(\zeta)$ .

(a) Show that  $\zeta$  is a root of a polynomial of degree 2 over  $\mathbb{Q}(\theta)$ .

(b) Show that  $K = \mathbb{R} \cap L$  and that  $L$  has degree 2 over  $K$ .

*Hint:*  $L \supset L \cap \mathbb{R} \supset K$ .

(c) Show that  $K$  is the fixed field of the automorphism  $\sigma$  of  $L$  determined by  $\sigma(\zeta) = \zeta^{-1}$ .

*Hint:*  $\sigma$  is just complex conjugation.

(d) Show that  $\mathcal{O}_K = \mathbb{R} \cap \mathbb{Z}[\zeta]$ .

(e) Let  $n = \varphi(m)/2$ . Show that

$$1, \zeta, \zeta^{-1}, \zeta^2, \zeta^{-2}, \dots, \zeta^{n-1}, \zeta^{-(n-1)}, \zeta^n$$

form an integral basis for  $\mathbb{Z}[\zeta]$ .

(f) Use part (e) to show that

$$1, \zeta, \theta, \theta\zeta, \theta^2, \theta^2\zeta, \dots, \theta^{n-1}, \theta^{n-1}\zeta$$

is another integral basis for  $\mathbb{Z}[\zeta]$ .

*Hint:* Write these in terms of the other basis and look at the resulting matrix.

(g) Show that

$$1, \theta, \theta^2, \dots, \theta^{n-1}$$

is an integral basis for  $\mathcal{O}_K$ . Conclude that  $\mathcal{O}_K = \mathbb{Z}[\theta]$ .

(h) **[Extra credit]** Suppose  $m$  is an odd prime  $p$ . Show that  $\text{disc}(K) = \pm p^{(p-3)/2}$ .
