

Comments on Eisenbud, Exercise 17.21  
 February 26, 2016

Recall the setup:  $k$  is a (commutative) ring and  $V \cong k^n$  is a finitely generated free  $k$ -module.  $S(V)$  is the symmetric algebra on  $V$  and  $\bigwedge(V^*)$  is the exterior algebra on the dual  $V^*$ . For simplicity, we will just assume that  $k$  is a field.

It is convenient to think of elements of  $V$  as having degree 1 and elements of  $V^*$  as having degree  $-1$ . Then these algebras both have graded decompositions:

$$S(V) = \bigoplus_{d \geq 0} S^d(V),$$

$$\bigwedge(V^*) = \bigoplus_{d \geq 0} \bigwedge^d(V^*),$$

(so  $S^d(V)$  has degree  $d$  while  $\bigwedge^d(V^*)$  has degree  $-d$ ).

The element  $t \in \bigwedge^1(V^*) \otimes S^1(V) = V^* \otimes V$  is the canonical trace element, i.e., pick a basis  $e_i$  for  $V$  and a dual basis  $e_i^*$  for  $V^*$  and take  $t = \sum_{i=1}^n e_i^* \otimes e_i$ ; this is independent of the choice of basis and  $t$  has degree 0.

In particular, multiplication by  $t$  is a degree-preserving operator on  $\bigwedge(V^*) \otimes S(V)$  and squares to 0 and we can identify the complex

$$0 \rightarrow S(V) \xrightarrow{t} V^* \otimes S(V) \xrightarrow{t} \bigwedge^2(V^*) \otimes S(V) \xrightarrow{t} \cdots \xrightarrow{t} \bigwedge^n(V^*) \otimes S(V)$$

with the Koszul complex on the elements  $e_1, \dots, e_n \in S(V)$ . We've already seen that this is exact except at the right end (since  $e_1, \dots, e_n$  is a regular sequence) at which case the homology is  $k$  (concentrated in degree  $-n$  since it's a quotient of  $\bigwedge^n(V^*) \otimes S(V)$  which is a free  $S(V)$ -module of rank 1 generated in degree  $-n$ ).

Since  $t$  is degree-preserving, we can decompose this into linear strands, i.e., for every  $d$ , you get a complex of  $k$ -modules of degree  $d$ :

$$(1) \quad 0 \rightarrow S^d(V) \rightarrow V^* \otimes S^{d+1}(V) \rightarrow \bigwedge^2(V^*) \otimes S^{d+2}(V) \rightarrow \cdots \rightarrow \bigwedge^n(V^*) \otimes S^{d+n}(V)$$

which is also valid for  $d < 0$  if we interpret  $S^d(V) = 0$  in this case. This complex is always exact and if  $d \neq -n$ , the last map is also surjective (this is just reformulating what we just said about the Koszul complex).

Multiplication by  $t$  also gives us this complex considered in (c):

$$(2) \quad \bigwedge(V^*) \rightarrow \bigwedge(V^*) \otimes S^1(V) \rightarrow \bigwedge(V^*) \otimes S^2(V) \rightarrow \cdots,$$

and again since it is degree-preserving, for any  $e$  we get a complex of  $k$ -modules of degree  $-e$ :

$$(3) \quad \bigwedge^e(V^*) \rightarrow \bigwedge^{e+1}(V^*) \otimes S^1(V) \rightarrow \bigwedge^{e+2}(V^*) \otimes S^2(V) \rightarrow \cdots.$$

This is the same complex as in (1) if we take  $d = -e$  (again, interpret negative exterior powers to be 0).

We know that (1) is exact if  $d \neq -n$ , so (3) is exact if  $e \neq n$ . In particular, we can extend (2) to an exact complex as follows:

$$(4) \quad 0 \rightarrow k \rightarrow \bigwedge(V^*) \rightarrow \bigwedge(V^*) \otimes S^1(V) \rightarrow \bigwedge(V^*) \otimes S^2(V) \rightarrow \dots,$$

where  $k$  is concentrated in degree  $-n$ .

To calculate  $\text{Ext}_{\bigwedge(V^*)}^*(k, k)$ , use that  $\bigwedge(V^*)$  is self-injective (i.e., injective as a module over itself, see Proposition 1 below) and so (4) is an injective resolution of  $k$ . Now apply  $\text{Hom}_{\bigwedge(V^*)}(k, -)$  to it and notice that all differentials become 0 by degree reasons, so

$$\text{Ext}_{\bigwedge(V^*)}^i(k, k) = \text{Hom}_{\bigwedge(V^*)}(k, \bigwedge(V^*) \otimes S^i(V)) = S^i(V)$$

(here we use that a  $\bigwedge(V^*)$ -linear map from  $k$  to  $\bigwedge(V^*)$  must land in  $\bigwedge^n(V^*)$ ).

Alternatively, you can do something with duals if you wanted to use a projective resolution of  $k$  as a  $\bigwedge(V^*)$ -module, but that gets a little bit more messy.

**Proposition 1.**  $\bigwedge(V^*)$  is self-injective.

*Proof.*  $\text{Hom}_k(\bigwedge(V^*), k)$  is an injective module over  $\bigwedge(V^*)$  (see Lemma A3.8 of Eisenbud, for example). Fix a generator  $z \in \bigwedge^n(V^*)$ . Define a pairing on  $\bigwedge(V^*)$  by setting  $\beta(a, b)$  to be the coefficient of  $z$  in  $a \wedge b$  (in the homogeneous decomposition of  $a \wedge b$ ). Then  $\beta$  is a perfect pairing. Define a map  $\bigwedge(V^*) \rightarrow \text{Hom}_k(\bigwedge(V^*), k)$  by  $a \mapsto f_a$  where  $f_a(b) = \beta(b, a)$ . Note that  $f_{a' \wedge a}(b) = \beta(b, a' \wedge a) = \beta(b \wedge a', a) = f_a(b \wedge a')$  so this is a module homomorphism. Since  $\beta$  is a perfect pairing, it's also an isomorphism. So we conclude that  $\bigwedge(V^*)$  is self-injective.  $\square$
