### **Optional Stopping**

Given a filtration,  $\{F_n, n = 0, 1, 2, ...\}$ , a <u>stopping time</u> (optional time) (relative to the filtration) is a random variable.

$$T: \Omega \longrightarrow \{0, 1, 2, ...\} \cup \{\infty\}$$

such that for each  $n = 0, 1, 2, ..., \{T = n\} = \{\omega \in \Omega : T(\omega) = n\} \in F_n$ .

## Simple Stopping Theorem

Suppose  $M = \{M_n, F_n, n = 0, 1, 2, ...\}$  is a martingale and T is the stopping time relative to  $\{F_n\}_{n=0}^{\infty}$ .

Assume there is a constant K such that  $T \leq K$  a.s. then  $E[M_T] = E[M_0]$ .

 $E[M_n] = E[M_0]$  for each n.

$$(M_T)(\omega) = (M_{T(\omega)})(\omega)$$

# Coin Flipping Example

If 
$$\omega = TTTHT$$
, then  $\tau = \inf\{n \ge 0 : x_n = H\}$ 

### Example

$$\frac{1}{\{\xi_i\}_{i=1}^{\infty}} \text{ iid } P(\xi_i = +1) = p, \ P(\xi_i = -1) = q \text{ where } p + q = 1, \ 0$$

$$\mu = E[\xi_i] = p - q \neq 0$$

 $X_n = x + \sum_{i=1}^n \xi_i$  where x is an integer between 0 and b (b > 0 integer)

$$M_n = X_n - n\mu, n = 0, 1, 2, \dots$$

$$F_n = \sigma\{X_1, ..., X_n\}, n = 1, 2, ...$$

$$F_0 = \{\emptyset, \Omega\} = \sigma\{X_0\}$$

Claim

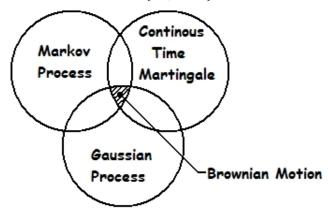

$$\begin{cases} M_n, F_n, n=0,1,2,\ldots \} \text{ is a martingale.} \\ T=\inf\{n\geq 0: X_n \text{ or } b\} \end{cases}$$
 T is a stopping time 
$$\begin{aligned} &\text{Tis a stopping time} \\ &\text{Fix } n\in\{0,1,2,\ldots\} \\ &\{T=n\}=\{X_0\notin\{0,b\},\{X_1\notin\{0,b\},...,X_{n-1}\notin\{0,b\},X_n\in\{0,b\}\}\in F_n \} \end{aligned}$$
 Theorem Suppose S and T are two stopping times. Then  $S\wedge T$  is also a stopping time. Also any deterministic time is a stopping time. Thus  $T\wedge N$  is a stopping time for each  $N\in\{0,1,2,\ldots\}.$  So  $T\wedge N\subseteq N$  and can apply stopping theorem. 
$$E[M_{T\wedge N}]=E[M_0] \\ &M_n=X_n-n\mu \text{ and } M_0=X_0=x\\ &\Rightarrow E[X_{T\wedge N}-(T\wedge N)\mu]=x\\ &|X_{T\wedge N}|\leq b, \text{ then } E[X_{T\wedge N}]-E[(T\wedge N)\mu]=x\\ &\mu E[T\wedge N]=E[X_{T\wedge N}]-x\\ &\mu E[T\wedge N]=E[X_{T\wedge N}]-x\\ &(\star)E[T\wedge N]=\frac{E[X_{T\wedge N}]-x}{\mu}\\ &E[T\wedge N]\leq \frac{b+x}{\mu}\\ &E[T\wedge N]\leq \frac{b+x}{\mu}\\ &E[T\wedge N]\leq \frac{b+x}{\mu}\\ &E[T\mid D]=\sum_{N\to\infty} T\wedge N\\ &\text{By Monotone Convergence Theorem}\\ &E[T]=\lim_{N\to\infty} E[T\wedge N]\leq \frac{b+x}{\mu}<\\ &\cong T<\infty \text{ a.s. and in fact } E[T]<\infty\\ &E[T\wedge N]\to E[T]\\ &(T\wedge N)\to E[T]\\ &(T\wedge N)\to D$$
 by Monotone Convergence  $E[T\wedge N]\to D$  by Monotone Convergence  $E[T\wedge N]\to E[T]$  as  $N\to\infty$  by Monotone Convergence  $E[T\wedge N]\to E[T]$  as  $N\to\infty$  by Monotone Convergence  $E[T\wedge N]\to E[T]$  as  $N\to\infty$  by Bounded Convergence  $E[X_{T\wedge N}]\to D$  by  $E[X_T]\to D$  b

[ Martingale  $Q_n = (\frac{q}{p})^{x_n}$ ] when T is finite w.p. 1 gives  $P(x_T = b)$ 

Brownian Motion - continuous time, continuos state (Wiener Process).

 $S = \Re(\text{one dimensional})$ 

Stochastic Process  $\{B_t, t \geq 0\}$ 

#### **Definition**

A standard one dimensional Brownian Motion is a stochastic process  $\{B_t, t \geq 0\}$  taking value in  $\Re$ , such that

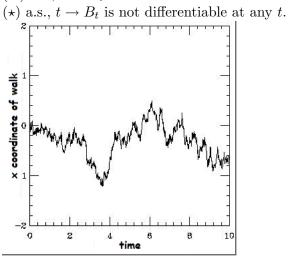

- (i)  $B_0 = 0$  a.s.
- (ii) (independent incerements)

 $\{B_{t_1} - B_{t_0}, B_{t_2} - B_{t_1}, ..., B_{t_n} - B_{t_{n-1}}\}$  are independent for any  $0 = t_0 < t_1 < ... < t_n$  and any n = 1, 2, ...

(iii) For any s, t,  $0 \le s < t < \infty$ 

 $B_t - B_s$  is a normal r.v. with mean 0 and variance t - s (stationary increment)

- (iv) a.s.,  $t \to B_t$  is continuous

# $\frac{\text{Evidence for }(\star)}{\text{Fix }t>0}$

$$\overline{\text{Fix } t > 0}$$

Fix 
$$t > 0$$
  
By distribution,  $\frac{B_{t+n} - B_t}{n} = \frac{B_h}{h} = \frac{\sqrt{h}B_1}{h} = \frac{B_1}{\sqrt{h}} \to \pm \infty$  as  $h \to 0$   
" $\frac{dB_t}{dt}$ " = white noise  $\int f(t)dB_t = \int f(t)$ "  $\frac{dB_t}{dt}$ "  $dt$  does not exist.

"
$$\frac{dB_t}{dt}$$
" = white noise

$$\int f(t)dB_t = \int f(t) \frac{dB_t}{dt} dt$$
 does not exist.
